STWIN.box - SensorTile Wireless Industrial Node Development Kit

Features

- Multisensing wireless platform for vibration monitoring and ultrasound detection
- Built around STWIN.box core system board with processing, sensing, connectivity, and expansion capabilities
- Ultra-low power Arm® Cortex®-M33 with FPU and TrustZone at 160 MHz, 2048 KB Flash memory (STM32U585AI)
- microSD™ card slot for standalone data logging applications
- On-board Bluetooth® Low Energy v5.0 wireless technology (BlueNRG-M2), Wi-Fi (EMW3080), and NFC (ST25DV64K)
- Option to implement authentication and brand protection secure solution with STSAFE-A110
- Wide range of industrial IoT sensors:
    - Ultra-wide bandwidth (up to 6 kHz), low-noise, 3-axis digital vibration sensor (IIS3DWB)
    - 3-axis accelerometer + 3-axis gyroscope iNEMO inertial measurement unit (ISM330DHCX) with Machine Learning Core
    - High-performance ultra-low-power 3-axis accelerometer for industrial applications (IIS2DLPC)
    - Ultra-low power 3-axis magnetometer (IIS2MDC)
    - High-accuracy, high-resolution, low-power, 2-axis digital inclinometer with Embedded Machine Learning Core (IIS2ICLX)
    - Dual full-scale, 1.26 bar and 4 bar, absolute digital output barometer in full-mold package (ILPS22QS)
    - Low-voltage, ultra low-power, 0.5°C accuracy I²C/SMBus 3.0 temperature sensor (STTS22H)
    - Industrial grade digital MEMS microphone (IMP34DT05)
    - Analog MEMS microphone with frequency response up to 80 kHz (IMP23ABSU)
- Expandable via a 34-pin FPC connector

Product summary

Product summary	
STWIN.box - SensorTile Wireless Industrial Node Development Kit	STEVAL-STWINBX1
Software example for STEVAL-STWINBX1	FP-SNS-DATALOG2
Ultra-low-power with FPU Arm Cortex-M33 with Trust Zone	STM32U585AII6Q
Vibrometer and temperature sensor expansion kit	STEVAL-C34KAT1
iNemo inertial module with embedded ISPU and temperature sensor expansion kit	STEVAL-C34KAT2
Presence detection add-on for STWIN.box	STEVAL-PDETECT1
Applications	Factory Automation / Industrial Sensors

Description

The STWIN.box (STEVAL-STWINBX1) is a development kit and reference design that simplifies prototyping and testing of advanced industrial sensing applications in IoT contexts such as condition monitoring and predictive maintenance.

It is an evolution of the original STWIN kit (STEVAL-STWINKT1B) and features a higher mechanical accuracy in the measurement of vibrations, an improved robustness, an updated bill of materials (BOM) to reflect the latest and best-in-class microcontroller unit (MCU) and industrial sensors, and an easy-to-use interface for external add-ons.

The STWIN.box kit consists of an STWIN.box core system, a 480mAh LiPo battery, an adapter for the ST-LINK debugger, a plastic case, an adapter board for DIL 24 sensors and a flexible cable.

The many on-board industrial-grade sensors and the ultra-low-power MCU enable applications that feature: ultra-low power, nine DoF motion sensing, wide-bandwidth vibration analysis, audio and ultrasound acoustic inspection, very precise local temperature, and environmental monitoring.

A rich set of software packages is available in source code. Optimized firmware libraries and a complete companion cloud application help to speed up the design cycle to develop end-to-end solutions.

DB4598 - Rev 5 - February 2025

The kit supports a broad range of connectivity options. For wired connectivity, it includes a USB Type-C® port that can be used for power supply, data transfer and STM32 programming via DFU, and an RS-485 transceiver. For wireless connectivity, the kit offers Bluetooth® Low Energy, Wi-Fi, and NFC options.

The STWIN.box also includes a 34-pin expansion connector for small form-factor daughter boards associated with the STM32 family, such as the STEVAL-C34KAT1, STEVAL-C34KAT2 and STEVAL-PDETECT1 expansion boards.

The STWIN.box is suitable for field trials, demonstrations, and proof of concept for industrial IoT applications that use ST software and third-party software.

1 Solution overview

Predictive maintenance applications collect and process data from a wide variety of sensors in order to identify potential failures in machinery before they happen. A principal requirement of such applications is that the condition monitoring equipment is placed very close to relevant machine componentry for the data to be reliable, which is why the STWIN.box node is designed to be small but robust, self-powered and capable of wireless communication. Another application issue is the high volumes of preferably real-time data processing involved, which can overwhelm centralized monitoring and control systems, and corresponding communication networks. Distributed (or decentralized) computing architectures represent a valid solution to this problem by performing data preprocessing and analytical operations directly on the node. The STWIN kit supports and can demonstrate this concept through sample applications in the firmware package running on the STM32U5 ultra-low-power microcontroller embedded on the core system board. An additional possibility is provided by the embedded processing capabilities of the IIS2ICLX and the ISM330DHCX sensors, thanks to their programmable finite state machine and machine learning core.
